TECHNICAL MANUAL

PUMP 65000 - NEW SERIES

Double line installations - oil and grease

DESCRIPTION

This pump has been designed to supply Double Line Systems on medium and heavy duty plant and machinery. A built-in mechanical device alternates the supply from the two outlets. A choice of gear ratios enables a pre-determined inversion time and thus cycle time to be obtained according to the plant requirements.

The pump consists basically of a main piston and a servo-piston, both of which are hardened and lapped into the cast body.

Discharge per stroke is approx. 0.7 c.c.

Normal operating pressure is 75 bar but a pressure control valve allows a pressure variation from 30-150 bar. The primary worm drive shaft and cam shaft are mounted on ball bearings.

The secondary reduction gear box, eccentrics and invertor mechanism are contained in an oil bath which is separated from the pump reservoir. The pump is available in four basic types:

- with primary worm reduction ratio 1:15
- with primary worm reduction ratio 1:30
- direct drive
- oscillating drive

9 reduction ratios have been designed to control the interval of the lubrication cycle. They can be applied to all 4 basic types of pumps.

Seven types of reservoirs are available:

- For grease: 5 kg - 10 kg - 30 kg - 65 kg -
- For oil : 5 lt - 30 lt - 65 lt

The mechanical inverting device gives a fixed time cycle without using an electrical control panel.

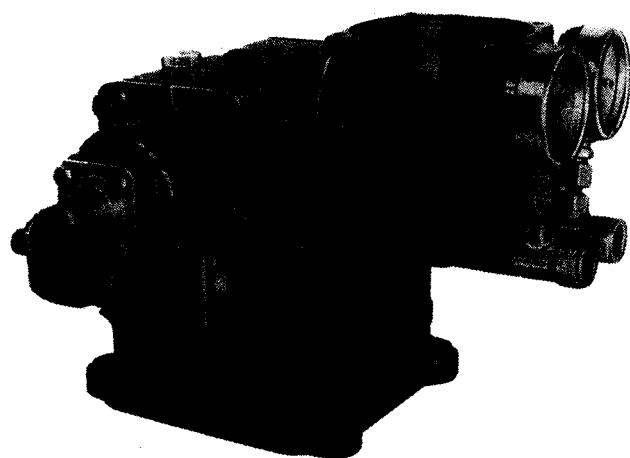

It is however preferable for long lubrication cycles to use an electric control panel to avoid the pump running for extended periods after lubrication has been completed. The control panel also provides a variable time cycle and will signal any possible fault.

MAINTENANCE

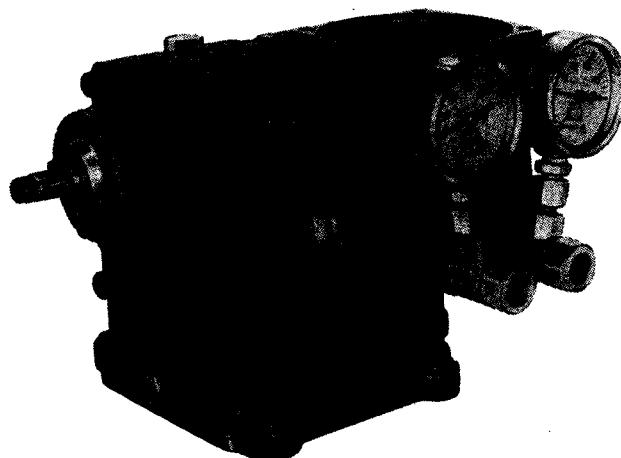

This pump unit does not require special maintenance. Before starting ensure that the gear box is filled with the correct grade of oil as per instructions.

Use only clean, non-corrosive lubricants and fill reservoir through filling attachment. When used for recirculating systems, lubricant must be filtered before returning to reservoir.

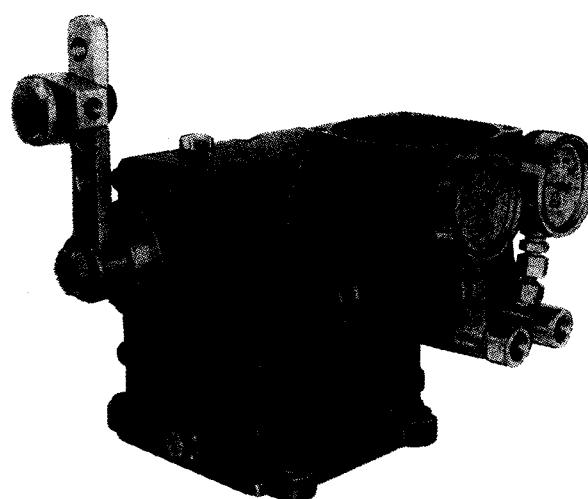

PUMP 65000 - NEW SERIES

Pump with reduction gears - Part No.76500*

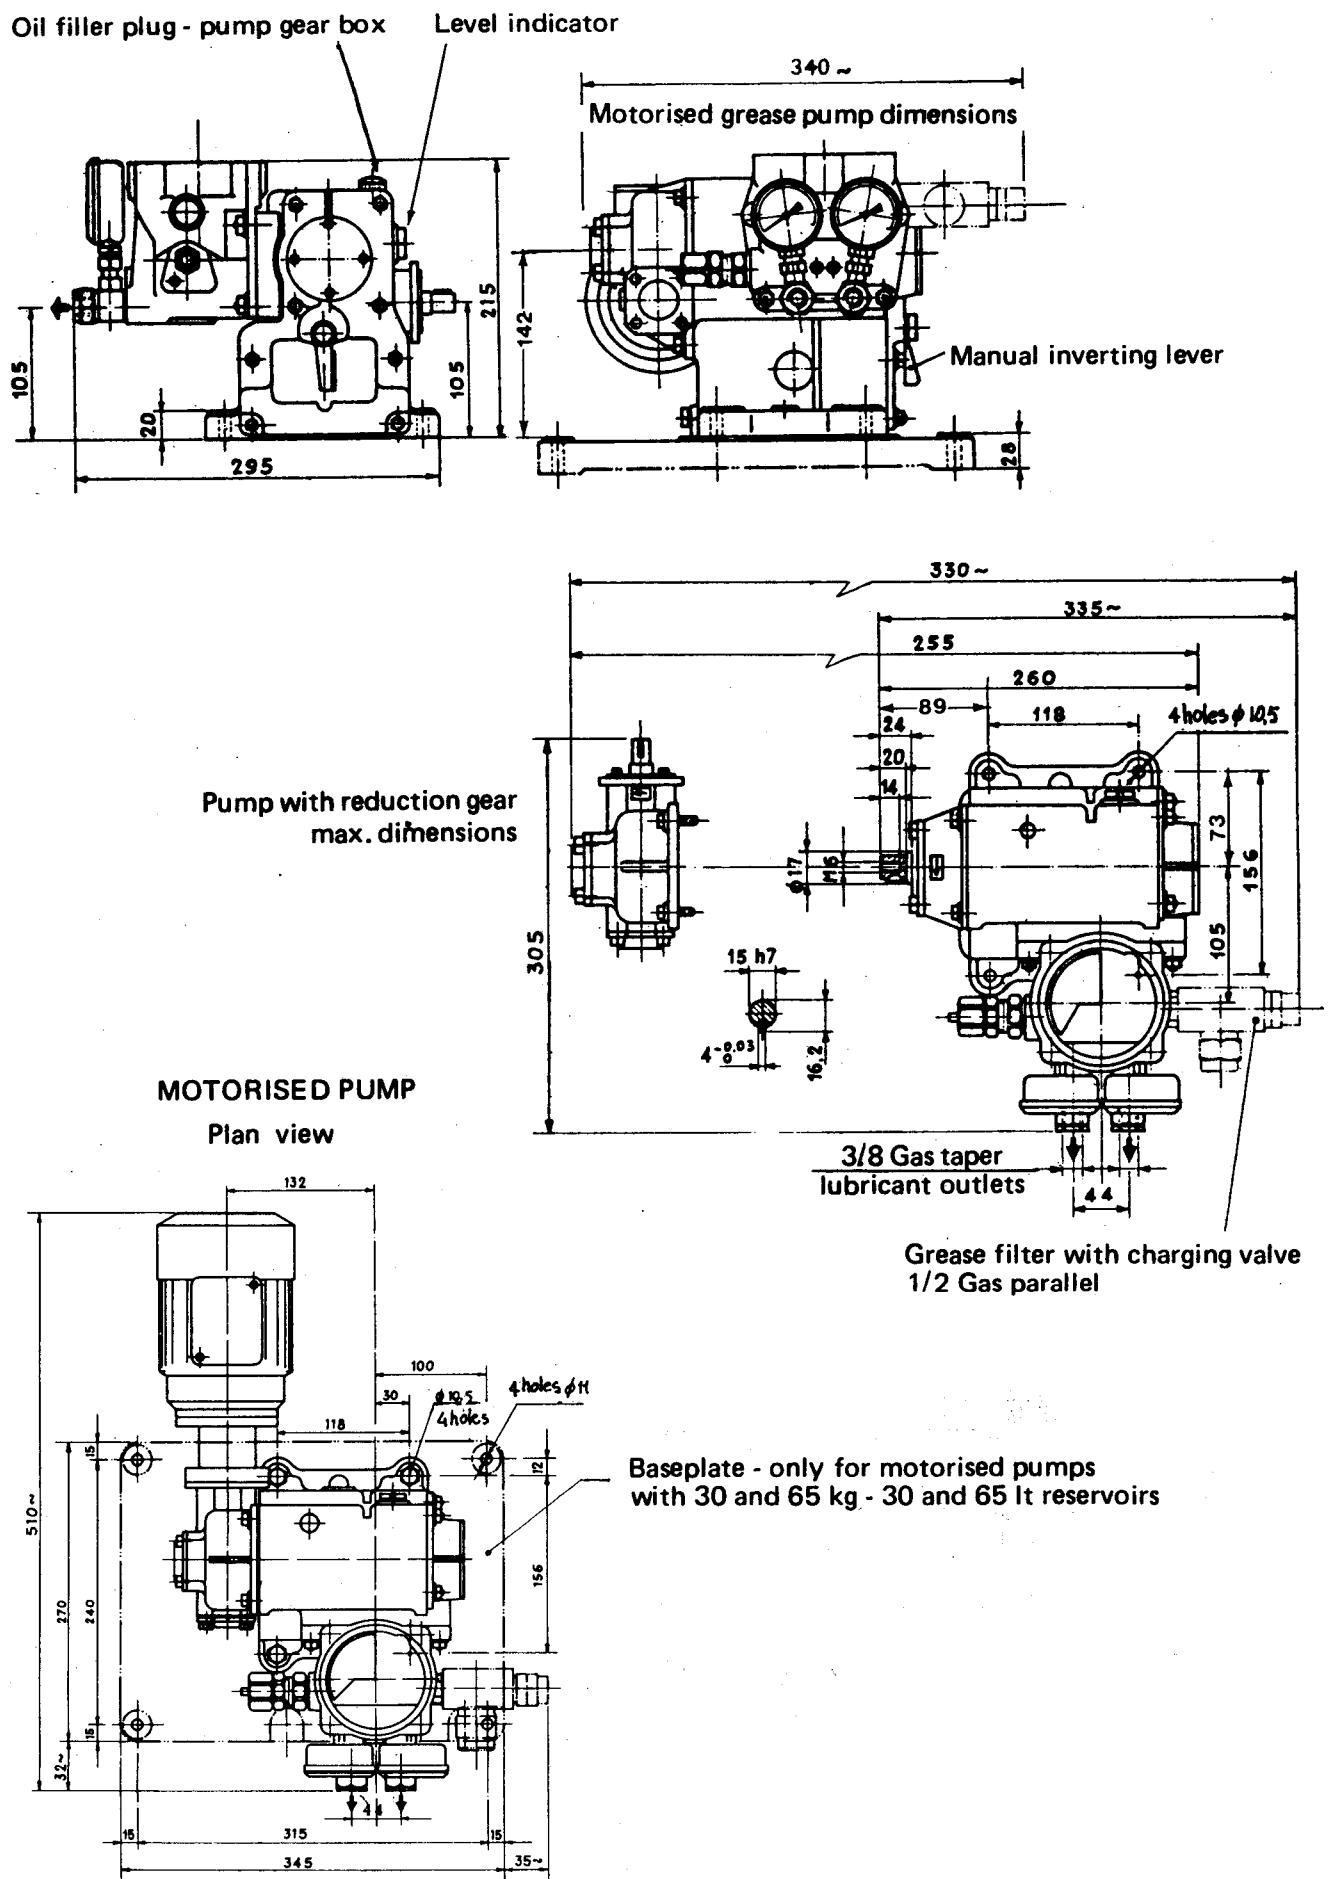

Pump with direct drive - Part No.65634*

Pump with oscillating drive - Part No.65635*

PUMPS AND MOTORISED PUMP DIMENSIONS

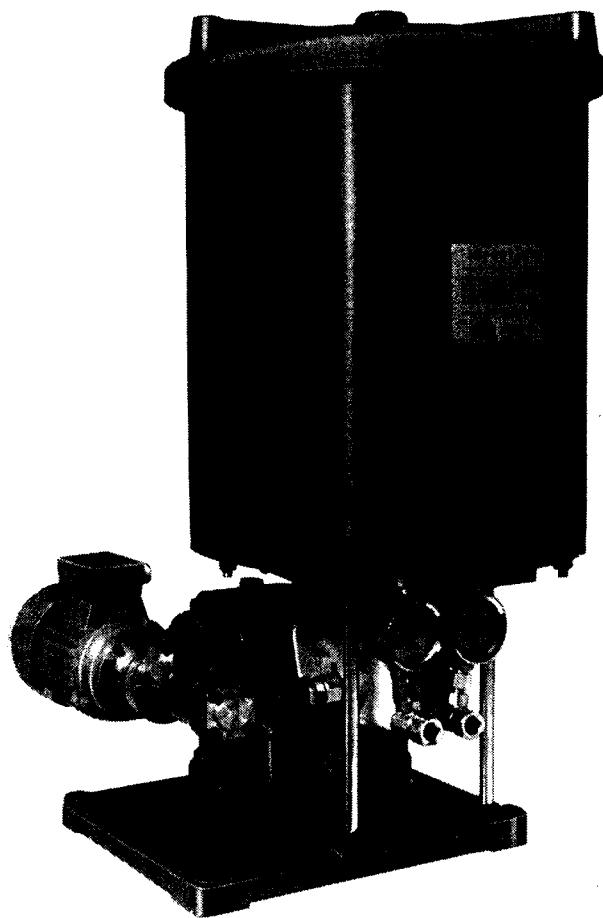

MOTORISED PUMPS WITH RESERVOIRS

Motors usually supplied are type P33

76534*

Motorised pump with 5 kg grease reservoir
(with low level switch)

76577*

Motorised pump with 30 lt oil reservoir
(without low level switch)

REDUCTION PERIOD AND CHOICE OF PUMP

The period is chosen according to the type of feeder used and the number of lubrication points (see Table A - page 7).

The maximum number of points permissible and the time indicated refer only to one inversion. A complete lubrication cycle consists of 2 inversions.

If double outlet feeders are used, the maximum number of points is twice that shown in the table.

When using an electric control panel, choose the lowest inversion time which will ensure that all points are lubricated.

CAUTION: When using direct drive pumps or with oscillating drive, do not exceed 100 r.p.m. for grease and 180 r.p.m. for oil.

USING TABLE A (page 7)

After deciding the type of feeder, 1 - 1.5 - 2 - 3 - 12 - 27 c.c., refer to the appropriate column and choose the period which corresponds to the number of points to be lubricated on each inversion.

Examples

1 - With 2 c.c. output feeders lubricating 40 points per inversion, the correct period is 4. For the same period the inversion time using a motorised pump is indicated; e.g. 4.48" using a 1400 r.p.m. motor and pump with 1:30 primary reduction.

2 - The table also indicates the number of revolutions of input shaft per inversion; e.g. a pump with 1:15 reduction and period 4 gear box inverts every 3456 revolutions of the input shaft.

N.B.: For longer intervals (using a pump without control panel) choose a higher period. When using pumps with control panel, the interval between one cycle and the other will be fixed by the timer in the control panel.

LUBRICANT CONSUMPTION IN 8 HOURS

Q Quantity of lubricant in grammes per 8 hours

N Number of permissible points per inversion

P Discharge in c.c.

I Number of inversions per 8 hours

n r.p.m.

i Number of revolutions per inversion

$$\text{Formula: } Q = N \times P \times I \times 0.9 \quad I = \frac{Q}{P \times N \times 0.9} \quad P = \frac{Q}{I \times N \times 0.9} \quad N = \frac{Q}{I \times P \times 0.9}$$

The value obtained represents the quantity of lubricant used on the complete installation in 8 hours with feeders set at max. output.

For motorised pumps the number of inversions per 8 hours is shown in the table. For other pumps the number of inversions per 8 hours can be calculated using the following formula.

$$I = \frac{n \times 60 \times 8}{i} \quad n = \frac{I \times i}{60 \times 8}$$

N.B.: The max. number of points to be lubricated is important. The values shown utilize 50% of the discharge per inversion. In some cases it is possible to increase the number of points per inversion. In extensive installations or with many flexibles it is better to choose a higher period than the one indicated.

REDUCTION PERIOD AND CHOICE OF PUMP

CODE NUMBER IDENTIFICATION

9 reduction ratios have been designed to control the interval of the lubrication cycle. They can be applied to all four basic types of pump. First design the installation and choose the most suitable gear ratio (see Table A - page 7); look for the Part No. in Table B and replace the asterisk with the ratio number.

Legend

Pumps

	Weight
H Pump with direct drive	- 12.400 kgs
L Pump with reduction gears R 1/15 - 13.750 kgs	
M Pump with reduction gears R 1/30 - 13.750 kgs	
N Pump with oscillating drive	- 13.400 kgs

Motorised pumps

O Motorised pump r.p.m.1400 - R 1/15	
P Motorised pump r.p.m.1400 - R 1/30	
Weight 21 kgs with baseplate	
18.500 kgs without baseplate	

N.B.: Weights indicated refer to pumps and motorised pumps without reservoir.

How to complete the code number with the period.

The chosen pump, consisting of a 1400 r.p.m. motor, ratio 1/15, 30 lt reservoir, minimum level switch, corresponds to the code number 76580* (read on the table B, Oil, Pos.O).

The above code number is completed replacing the asterisk with the proper period number.

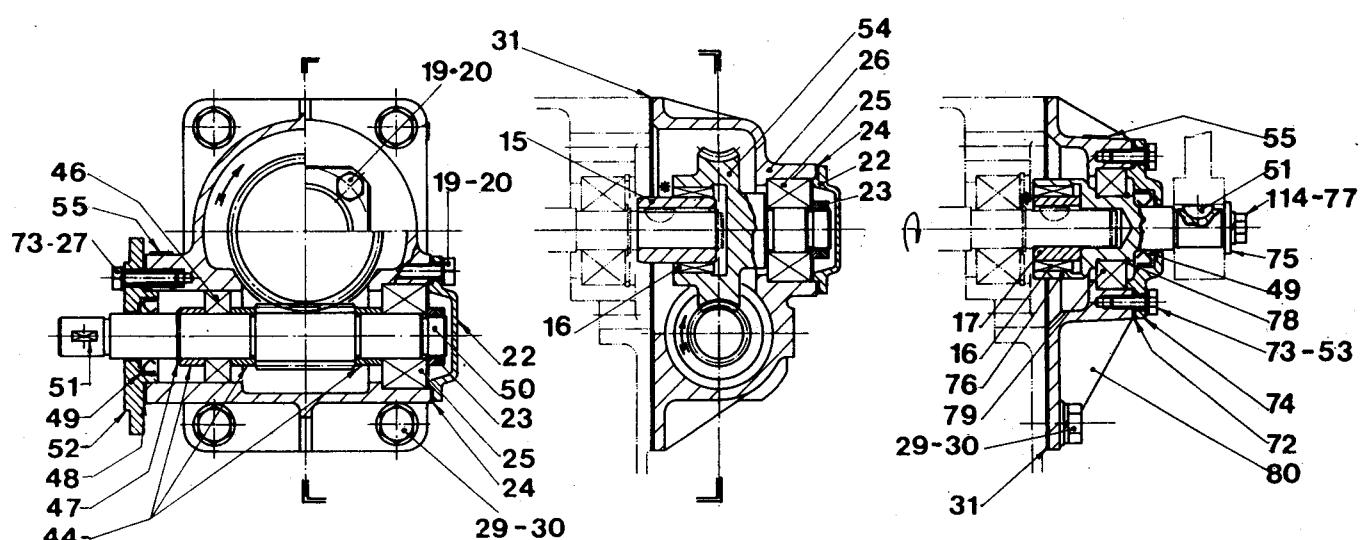

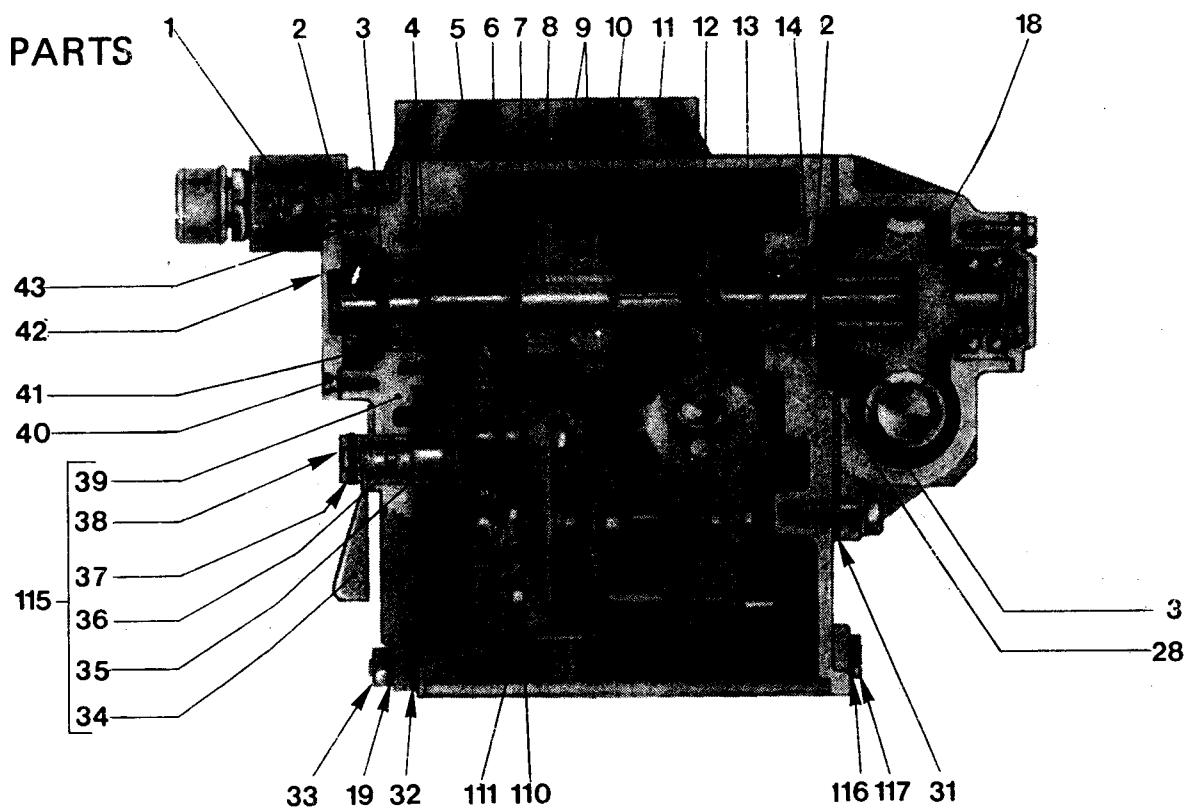

Example: for 3rd period 765803
for 4th period 765804

N.B.: The motorised pumps are normally supplied equipped with 220/380 V - 50 cycle motor.

On demand other voltages are available.

OIL RESERVOIRS

CHARACTERISTICS

The oil reservoirs are equipped with an external sight indicator and can have a low level switch.
For lubrication installations with oil return a filter with magnetic plug is available, which is fitted on the external side of the return piping.

REFILLING

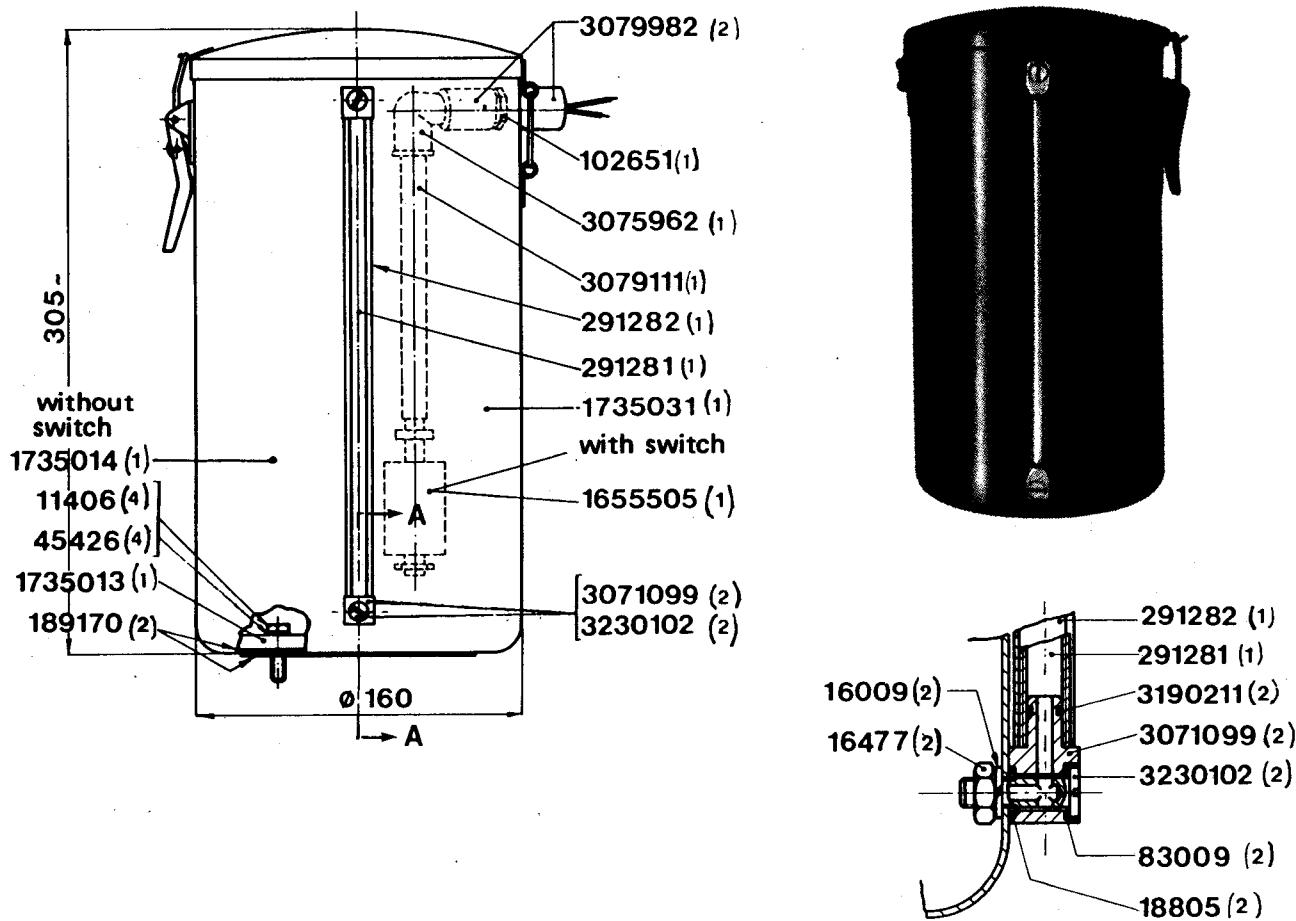

Can be done with the following types of pumps:

- Portable manual pump with 12 lt reservoir, Part No.132054
- Manual pump with trolley with 12 lt reservoir, Part No.132056
(hose, Part No.101775 to be ordered separately)
- Manual pump for 200 lt drum, Part No.132630
(hose with oil transfer valve, Part No.101777- hose without oil transfer valve, Part No.101778
- cover for drum, Part No.1141500 - filter, Part No.1113240 to be ordered separately).
- Air operated transfer pump - ratio 4/1 for 200 lt drum, Part No.2036702
(air hose, Part No.101100 - lubricant hose, Part No.101360 - cover for drum, Part No.1141515
- filter, Part No.234281)
- Air operated transfer pump - ratio 1/1 for 200 litre drum complete with hose, Part No.72161

N.B.: When specifying indicate hose length L, in cm.

1735015 - 5 lt reservoir without low level switch.
Weight 2.300 kg

1735020 - 5 lt reservoir with low level switch.
Weight 3 kg

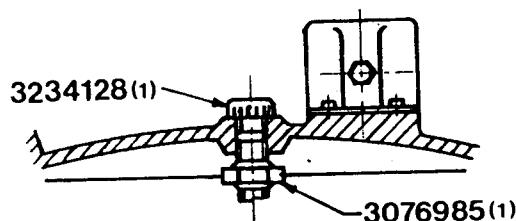

Section A-A

OIL RESERVOIRS

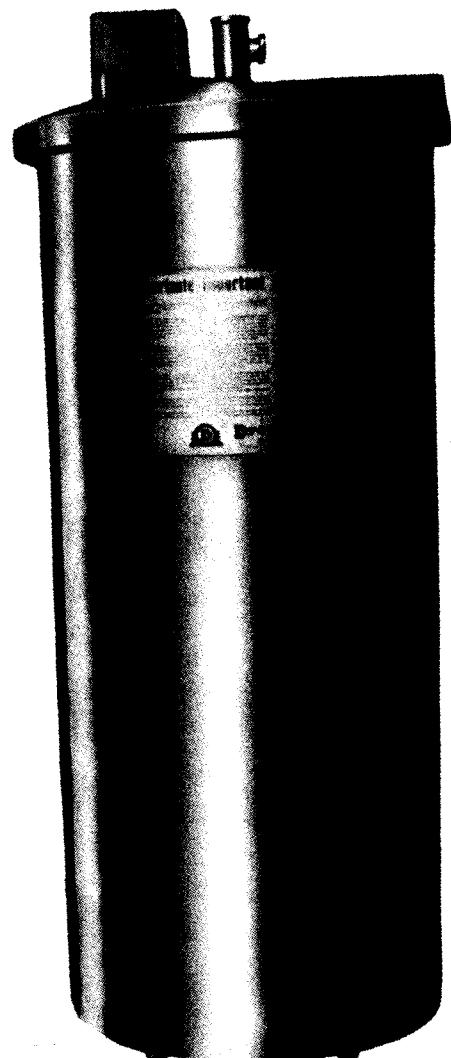

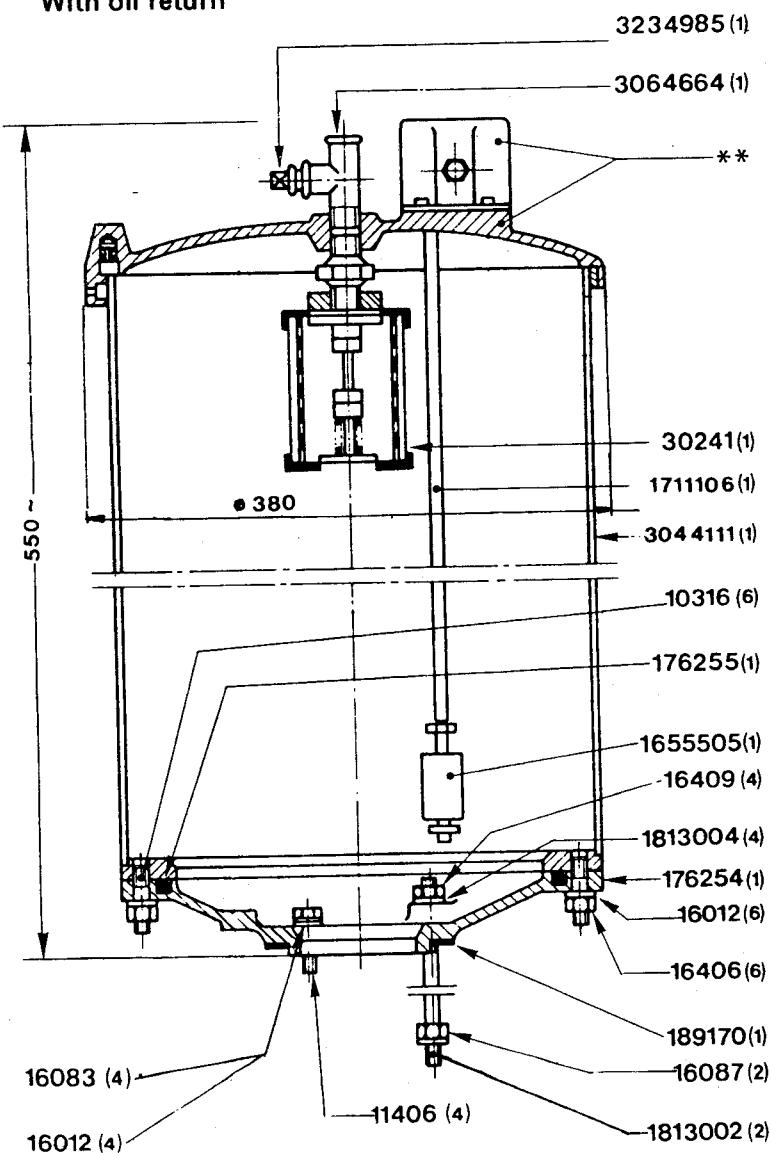

- 1711010 - 30 lt reservoir without low level switch. Weight 6.200 kg
- 1711105 - 30 lt reservoir with low level switch. Weight 6.800 kg
- 1711155 - 30 lt reservoir with oil return and low level switch. Weight 7.200 kg
- 1711205 - 30 lt reservoir with oil return without low level switch. Weight 6.600 kg

- **176260 - Cover with low level switch - standard
